Dear Ms. Warden:

RE: Toxicity Characteristic Leachate Procedure (TCLP) Results for Slag at the
Herculaneum Lead Smelter Site

Enclosed are analytical results for slag samples collected from the slag pile at the south end of the smelter facility located in Herculaneum, Missouri. I have also included a Health Consultation that addresses some of the concerns you raised at the last Community Action Group meeting. We will be collecting additional samples from the football field and the bleachers in the near future to see if lead levels have increased. I will provide you with that data when it becomes available.

I can be reached at 913-551-7755 if you have any questions concerning this matter.

Sincerely,

Bruce A. Morrison
